UniProt_02:*
1: uniprot_sprot:*
2: uniprot_trembl:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Voltage-sensitive calcium channels (VSCC) mediate the calcium ions into excitable cells and are also involved ety of calcium-dependent processes, including muscle on, hormone or neurotransmitter release, gene expression, lity, cell division and cell death. The isoform alpha-IG e to T-type calcium currents. T-type calcium channels the "low-voltage activated (LVA)" group and are strongly y mibefradil. A particularity of this type of channels is g at quite negative potentials and a voltage-dependent ion. T-type channels serve pacemaking functions in both eurons and cardiac nodal cells and support calcium in secretory cells and vascular smooth muscle. They may nvolved in the modulation of firing patterns of neurons important for information processing as well as in cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PECIFICITY: Highly expressed in brain, in particular in falla, subthalamic nuclei, cerebellum and thalamus.

expression in heart; low expression in placenta, kidney also expressed in colon and bone marrow and in tumoral a lesser extent. Highly expressed in fetal brain, but peripheral fetal tissues as heart, kidney and lung, a developmentally regulated expression.

Each of the four internal repeats contains five bic transmembrane segments (S1, S2, S3, S5, S6) and one bic transmembrane segment (S4). S4 segments represent the voltage-sensor and are characterized by a fositively charged amino acids at every third position. The linker region between repeat III and IV probably play in the inactivation of the channel. The C-terminal part may cated in the anchoring of the protein to the membrane, interfering/restricting its lateral diffusion.

response to raising of intracellular calcium, the T-type are activated by CaM-kinase II.

"In Avariety of calcium-dependent processes, including muscle call motility, cell division and cell death. The isoform alpha-IH gives rise to T-type calcium channels belong to the "low-voltage activated (LVA)" group and are strongly blocked by nickel and mibefradil. A particularity of this type of channels is an opening at quite negative potentials, and a voltage-dependent inactivation. T-type channels serve pacemaking functions in both central neurons and cardiac nodal cells and support calcium signaling in secretory cells and vascular smooth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A. DNA Res. 6:329-336(1999).

Libralies from channels (VSCC) mediate the entry of calcium into excitable cells and are also involved in a variety of calcium-dependent processes, including muscle contraction, hormone or neurotransmitter release, gene expression, cell motility, cell division and cell death. Isoform alpha-1I gives rise to T-type calcium currents. T-type calcium channels gives rise to T-type calcium currents. T-type calcium channels belong to the "low-voltage activated (LVA)" group and are strongly blocked by nickel and mibefradil. A particularity of this type of channels is an opening at quite negative potentials, and a voltage-dependent inactivation. T-type channels serve pacemaking functions in both central neurons and cardiac nodal cells and support calcium signaling in secretory cells and vascular smooth muscle. They may also be involved in the modulation of firing patterns of neurons which is important for information processing as well as in cell growth processes. Gates in voltage ranges similar to, but higher than alpha 1G or alpha 1H (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            aracterization of cDNA clones selected by the GeneMark analysis m size-fractionated cDNA libraries from human brain."; FURS. 6:329-336(1999).

                                                                                                                                                                                                                                                                                                                                                                                                                                                 family.

CAUTION: Ref.4 (CAB62996) sequence differs from that shown due to erroneous gene model prediction.
                   Isold-OpPOX4-4; Sequence=VSP 000950;
TISSUE SPECIFICITY: Brain specific.
DOMAIN: Each of the four internal repeats contains five
DOMAIN: Each of the four internal repeats contains five
hydrophobic transmembrane segments (S1, S2, S3, S5, S6) and one
positively charged transmembrane segment (S4). S4 segments
probably represent the voltage-sensor and are characterized by a
probably represent the voltage-sensor and are characterized by a
series of positively charged amino acids at every third position.
PTM: In response to raising of intracellular calcium, the T-type
channels are activated by CaM-kinase II (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sof repeat I (Fotential).

entry of calcium ions into excitable cells and are also involved in a variety of calcium ions into excitable cells and are also involved in a variety of calcium-dependent processes, including muscle contraction, hormone or neurotransmitter release, gene expression, cell motility, cell division and cell death. Isoform alpha-11 gives rise to T-type calcium currents. T-type calcium channels belong to the "low-voltage activated (LVA)" group and are strongly blocked by nickel and mibefradil. A particularity of this type of channels is an opening at quite negative potentials, and a voltage-dependent inactivation. T-type channels serve pacemaking functions in both central neurons and cardiac nodal cells and support calcium signaling in secretory cells and vascular smooth muscle. They may also be involved in the modulation of firing patterns of neurons which is important for information processing as well as in cell growth processes. Gates in voltage ranges similar to, but higher than alpha 1G or alpha 1H.

-: SUBCELLULAR LOCATION: Integral membrane protein.
-: SUBCELLULAR LOCATION: Integral membrane protein.
-: DOMAIN: Bach of the four internal repeats contains five positively charged transmembrane segment (S4). S4 segments protably represent the voltage-sensor and are characterized by a probably represent the voltage-sensor and are characterized by series of positively charged anino acids at every third position.
-:- FTWILLER INTERPRETATION of intracellular calcium, the T-type channels are activated by CaM-kinase II (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            EMBL; AF086827; AAD17796.2; -.

New nucleic acid encoding human calcium channel protein, useful for identifying specific modulators and potential pharmaceuticals for treating e.g. epilepsy.

The invention relates to isoform of human T-type low voltage activated calcium channel (alpha1G-c) cDNA and protein. Cells transformed with calcium channel DNA to express calcium alpha1G-c channel protein are used to identify specific modulators (antagonists or agonists). These modulators are useful as therapeutic agents and are used for treating calcium alpha1G-c channel-mediated disorders, e.g. stress epilepsy, schizophrenia, depression, sleep disorders, Cushing's disease, endocrine disorders, respiratory disorder, peripheral muscle disorder, muscle excitability, fertilisation, contraception, disorders involving hypertension, neuronal firing regulation, potentiation of synaptic signals and cardiovascular disorders (e.g. atherosclerosis, cardiac hypertrophy, angina pectoris). Calcium alpha1G-c channel DNA is useful for isolating and identifying related molecule mutations. It is also optionally used as antisense sequences, in gene therapy. Calcium channel coptional assays. The present sequence is T-type low voltage immunological assays. The present sequence is T-type low voltage English

This sequence represents a human T-type voltage-gated calcium (Ca) channel alpha-1-G designated hCavTld. Voltage gated channels are membrane bound glycosylated proteins formed of several subunits. The large alpha subunits form a pore in the membrane that is selective for a given ionic species. Each alpha subunit contains 4 domains (I, II, III and IV) and

                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                      240
                                                                                                                                                                                                                                                                                                                                                                                           240
each domain contains 6 putative transmembrane helical segments (S1-S6).

-type Ca channels are activated at a lower voltage than L- or N-type channels. Characteristics of T-type channels include short current time, slow activation kinetics near threshold, fast inactivation kinetics and slow tail current. The sequences AAX83481-X83492 represent novel T-type voltage-gated Ca channel genes from humans and rats. Each of the novel C-channels contains a putative IVS4 region comprising the amino acid sequence AAY14598. Cells expressing the T-type voltage-gated calcium channel proteins can be used to screen for drugs which affect calcium channels. Methods are also disclosed for treating a disease or disorder associated with a deficiency in a native T-type calcium channel nucleic acid, e.g. to treat cardiomyopathy, epilepsy, etc
                                                                                                                                                                                                                                                                                                                                                                                                                  300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      540

H altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRF) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention. 120 180 240 300 360 360 420 420 480 480 540 540 600 9 009 9 EESGOPRSFMRLNDLSGAGGRPGPGSAEKDPGSADSEAEGLPYPALAPVV DDFIFAFFAVEMVVKMVALGIFGKKCYLGDTWNRLDFFIVIAGMLEYSLDLQNVSFSAVR TVRVLRPLRAINRVPSMRILVTLLLDTLPMLGNVLLLCFFVFFIFGIVGVQLWAGLLRNR TTCVNWNQYYTNCSAGBHNFFKGAINFDNIGYAWIAIFQVITLEGWVDIM YFVMDAHSFYNFIYFILLIIVGSFFMINLCLVVIATQFSETKQRESQLMREQRVRFLSNA SCYEELLKYLVYILRKAARRLAQVSRAAGVRVGLLSSPAPLGGQETQPSS Gaps SVHSFYHADCHLEPVRCQAPPPRSPSEASGRTVGSGKVYPTVHTSPPPE Length 2243 Indels 7; VHHL VHHHHHHHHHYHLGNGTLRAPRASPET 1; DB Score 11758.5; Pred. This sequence represents a human T-type voltage-gated calcium (Ca) channel alpha-1-G designated hCavTla. Voltage gated channels are membrane bound glycosylated proteins formed of several subunits. The large alpha subunits form a pore in the membrane that is selective for a given ionic species. Each alpha subunit contains 4 domains (I, II, III and IV) and each domain contains 6 putative transmembrane helical segments (S1-S6). Trype Ca channels are activated at a lower voltage than L- or N-type channels. Characteristics of T-type channels include short current time, slow activation kinetics near threshold, fast inactivation kinetics and slow tail current. The sequences AAX83481-X83492 represent novel T-type voltage-gated Ca channel genes from humans and rats. Each of the novel Ca-channels contains a putative IVS4 region comprising the amino acid
                                                                                                                   2100

                                                                                                09
sequence AAY14598. Cells expressing the T-type voltage-gated calcium channel proteins can be used to screen for drugs which affect calcium channels. Methods are also disclosed for treating a disease or disorder associated with a deficiency in a native T-type calcium channel nucleic acid, e.g. to treat cardiomyopathy, epilepsy, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PDRKNFDSLLWAIVTVFQILTQEDWNKVLYNGMASTSSWAALYFIALMTFGNYVLFNLLV

This sequence represents a human T-type voltage-gated calcium (Ca)
channel alpha-1-G designated hCavTlb. Voltage gated channels are membrane
chound glycosylated proteins formed of several subunits. The large alpha
subunits form a pore in the membrane that is selective for a given ionic
companies. Each alpha subunit contains 4 domains [1, II, III and IV) and
companies. Each alpha subunit contains 4 domains [1, II, III and IV) and
companies. Characteristics of T-type channels segments (S1-S6). The channels. Characteristics of T-type channels include short current time,
slow activation kinetics near threshold, fast inactivation kinetics and
slow tail current. The sequences AAX83481-X83492 represent novel T-type
companies contains a putative IVS4 region comprising the amino acid
channels contains a putative IVS4 region comprising the amino acid
companies. Methods are also disclosed for treating a disease or disorder
acid, e.g. to treat cardiomyopathy, epilepsy, etc

This sequence represents a human T-type voltage-gated calcium (Ca) channel alpha-1-G designated hCavTIC. Voltage gated channels are membrane channel alpha-1-G designated hCavTIC. Voltage gated channels are membrane to bound glycosylated proteins formed of several subunits. The large alpha subunits form a pore in the membrane that is selective for a given ionic species. Each alpha subunit contains 4 domains (I, II, III and IV) and cach domain contains 6 putative transmembrane helical segments (S1-S6). The cach domain contains 6 putative transmembrane helical segments (S1-S6). The channels are activated at a lower voltage than L- or N-type channels. Charnels are activated at a lower voltage than L- or N-type slow activation kinetics near threshold, fast inactivation kinetics and slow activation kinetics near threshold, fast inactivation kinetics and slow activation kinetics near threshold, fast inactivation kinetics and collaboration in the sequences AAX83492 represent novel T-type channels contains a putative IVS4 region comprising the amino acid channels contains can be used to screen for drugs which affect calcium channels. Methods are also disclosed for treating a disease or disorder associated with a deficiency in a native T-type calcium channel nucleic acid, e.g. to treat cardiomyopathy, epilepsy, etc

An expression cassette has been generated which comprises a nucleotide sequence encoding a T-type calcium channel alpha_1 subunit operably linked to control sequences to effect its expression. The novel calcium channel nucleic acids and proteins are useful for treating conditions characterised by undesirable levels of T-type calcium channel activity such as cardiac hypertrophy, cardiac arrhythmia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   120

The protein shows 96.3 % identity to the neuronal T-type calcium channel alphal subunit (alphalG). The T-type Ca2+ channel from INS-1 (alphalG-INS) and neuronal alphalG are alternative splice isoforms of the same gene. The INS-1 isoform is also expressed in brain, neonatal heart and kidney besides pancreatic beta cells. T-type Ca2+ channel belongs to the family of low voltage activated Ca2+ channels. The present sequence is used for treating diseases associated with abnormal expression or

                                                                                                                                                                                                                                                                                                                                                                                 240
function of T-type calcium channels. They are especially used for treating type II diabetes. Modulators of pancreatic T-type Ca2+ channel e.g. antisense oligonucleotides, ribozymes and inhibitors are used in methods for modifying insulin secretion by pancreatic beta cells, basal calcium levels, potential L type calcium channel activity, pancreatic cell death, pancreatic beta cell proliferation and calcium influx through L type calcium channels in cells
                                                                                                                                                                                                                                                                 120

This sequence represents a rat T-type voltage-gated calcium (Ca) channel alpha-1-G designated rCavTld. Voltage gated channels are membrane bound glycosylated proteins formed of several subunits. The large alpha subunits form a pore in the membrane that is selective for a given ionic species. Each alpha subunit contains 4 domains (I, II, III and IV) and cach domain contains 6 putative transmembrane helical segments (S1-S6). The cach annels are activated at a lower voltage than L- or N-type channels. Characteristics of T-type channels include short current time, slow activation kinetics near threshold, fast inactivation kinetics and slow tail current. The sequences AAX83481-X83492 represent novel T-type voltage-gated Ca channel genes from humans and rats. Each of the novel Ca channels contains a putative IVS4 region comprising the amino acid sequence AAY14598. Cells expressing the T-type voltage-gated calcium channel proteins can be used to screen for drugs which affect calcium

This sequence represents a rat T-type voltage-gated calcium (Ca) channel
alpha-1-G designated rCavTla. Voltage gated channels are membrane bound
clapha-1-G designated rCavTla. Voltage gated channels are membrane bound
clapha-1-G designated broteins formed of several subunits. The large alpha
clapha subunit contains 4 domains (I, II, III and IV) and
cach domain contains 6 putative transmembrane helical segments (S1-S6). T
channels. Characteristics of T-type channels include short current time,
channels. Characteristics near threshold, fast inactivation kinetics and
slow tail current. The sequences AAX81481-X83492 represent novel T-type
coltage-gated Ca channel genes from humans and rats. Each of the novel Ca
channels contains a putative IVS4 region comprising the amino acid
channels channels can be used to screen for drugs which affect calcium
channels. Methods are also disclosed for treating a disease or disorder
associated with a deficiency in a native T-type calcium channel nucleic
acid, e.g. to treat cardiomyopathy, epilepsy, etc

gated calcium channels

This sequence represents a rat T-type voltage-gated calcium (Ca) channel alpha-1-G designated rCavTlb. Voltage gated channels are membrane bound alpha-1-G designated rCavTlb. Voltage gated channels are membrane bound calyocosylated proteins formed of several subunits. The large alpha gubunits form a pore in the membrane that is selective for a given ionic sech domain contains 6 putative transmembrane helical segments (S1-S6). The channels are activated at a lower voltage than L- or N-type channels. Characteristics of T-type channels include short current time, channels contains a putative IvS4 region comprising the amino acid channels contains a putative IvS4 region comprising the amino acid channels can be used to screen for drugs which affect calcium channels. Methods are also disclosed for treating a disease or disorder associated with a deficiency in a native T-type calcium channel nucleic asid, e.g. to treat cardiomyopathy, epilepsy, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

Voltage gated channels are membrane bound alpha-1-G designated rCavTIC. Voltage gated channels are membrane bound glycosylated proteins formed of several subunits. The large alpha subunits form a pore in the membrane that is selective for a given ionic seach domain contains 6 putative transmembrane helical segments (S1-S6). The cach domain contains 6 putative transmembrane helical segments (S1-S6). The channels are activated at a lower voltage than 1- or N-type cannels. Charnels are activated at a lower voltage than 1- or N-type calcivation kinetics and slow activation kinetics and slow activation kinetics and slow activation kinetics and slow activation kinetics and slow activation contains a putative IVS4 region comprising the amino acid channels contains a putative IVS4 region comprising the amino acid channel proteins can be used to screen for drugs which affect calcium channels. Methods are also disclosed for treating a disease or disorder associated with a deficiency in a native T-type calcium channel nucleic acid, e.g. to treat cardiomyopathy, epilepsy, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

The present sequence is given in a specification providing sequences and partial sequences for three types of mammalian (human and rat) T-type calcium channel subunits. An expression cassette has been generated which comprises a nucleotide sequence encoding a T-type calcium channel alpha_1 subunit operably linked to control sequences to effect its expression. The novel calcium channel nucleic acids and proteins are useful for treating conditions characterised by undesirable levels of T-type calcium channel activity such as cardiac hypertrophy, cardiac arrhythmia,
                                                                                                                         Rat; expressed sequence tag; EST; antiarrhythmic; anticonvulsant; hypotensive; cardiant; nootropic; T-type calcium channel subunit; cardiac hypertrophy; cardiac arrhythmia; hypertension; sleep disorder; epilepsy; alpha-IG calcium channel.
                                                                                                                                                                                                                                                                                                                                                                                                Novel T-type calcium channel alpha-1 subunit gene useful for treating cardiac hypertrophy, cardiac arrhythmia, hypertension, sleep disorder

marker for screening cancer, be calcium channel and regulatory ecule for use as a ma region for a T-type with the channel. molecule for comprises the coding sequences associated New nucleic acid m comprises the codi

9; Fig 3B; 12 Claim

The present sequence representing a novel human T-type calcium channel
CACNA1G maps to chromosome 17. The methylation state of specific regions
within CpG islands associated with the CACNA1G gene correlate with
several cancerous phenotypes involving various tissue and cell types.
Since aberrant methylation of normally unmethylated CpG islands is often
cellular proliferative disorders e.g. leukaemia, colorectal, lung, breast
and other cancers. The nucleic acid coding for CACNA1G is useful as a
marker for screening cancer and age related diseases. A diagnostic kit
containing primers (AAS01574-AAS01623) for amplification of a CpGcontaining nucleic acid, where the primer hybridises with a target
containing nucleic acid, where the primer hybridises with a target
containing nucleic acid, where the primer hybridises with a farget
containing nucleic acid, sequence (AAS01676), can be used for detecting
polynucleotide sequence (AAS01627-AAS01676), can be used for detecting
selected from genes encoding CACNA1G, apolipoprotein B (APOB), caudal
type homeobox transcription factor 2 (CDX2), epidermal growth factor
ceptor (BGFR), fibrillin-1 (FBN1), G protein-coupled receptor 37
(GPR37), heat shock 70kD protein 6 (HSP70B', HSPA6), RasGAP-related
containing homeodomain transcription factor 2 (PITX2), patched A and B
corrective homeodomain transcription factor 2 (PITX2), or a MINT 31 sequence

sequence is given in a specification providing sequences and uences for three types of mammalian (human and rat) T-type nnel subunits. An expression cassette has been generated which nucleotide sequence encoding a T-type calcium channel alphalrably linked to control sequences to effect its expression. alcium channel nucleic acids and proteins are useful for nditions characterised by undesirable levels of T-type calcium ivity such as cardiac hypertrophy, cardiac arrhythmia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GGGGPPCGLDYEAY-----NSSSNTTCVNWNQYYTNCSAGEHNPFKGAINF
